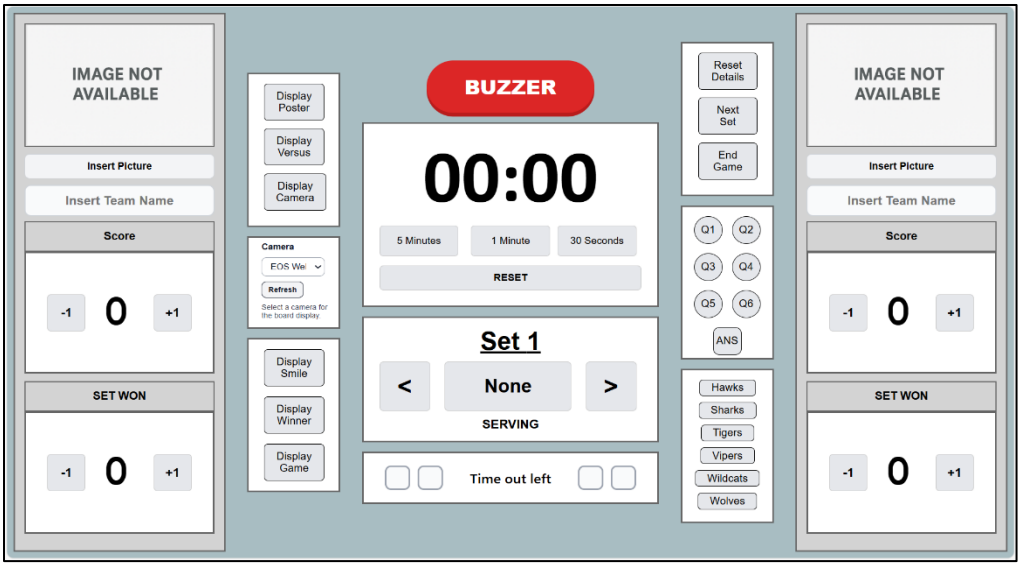
March 2026

Controller Page (*Volleyball Board Controller Link*)



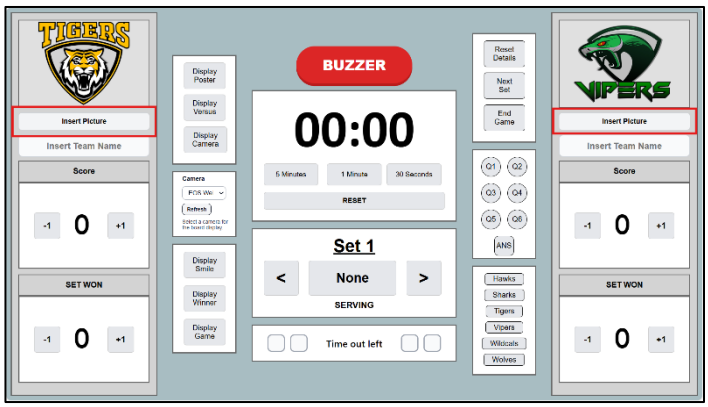
This page serves as the controller page of the system scoring board, where all core game functionalities are managed. From this page, operators can set up teams, configure game details, and manage essential game settings before and during gameplay. It acts as the central hub for controlling the game flow, allowing real-time adjustments, status monitoring, and accurate score management throughout the match.

Display Page (*Volleyball Scoreboard Link*)

This page serves as the display page of the system scoring board. This page shows all details and output generated from the controller page, including scores, team information, and game status. It reflects the real-time updates made by the operator and presents them clearly for viewing. The Board Page functions like the official display shown on the monitor during a volleyball match, ensuring that players, officials, and spectators can easily see the current game information.

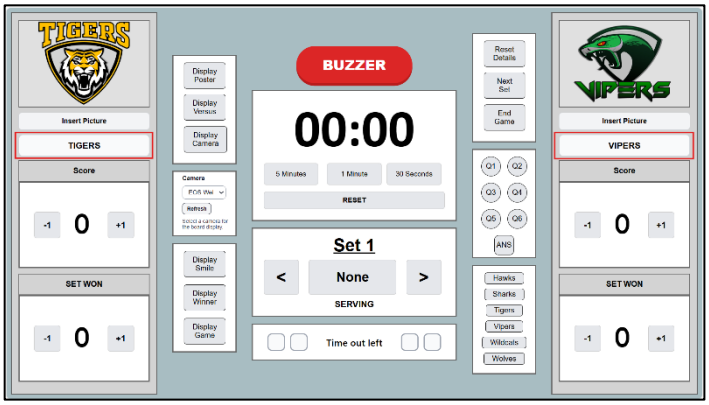
- **Insert Team Picture**

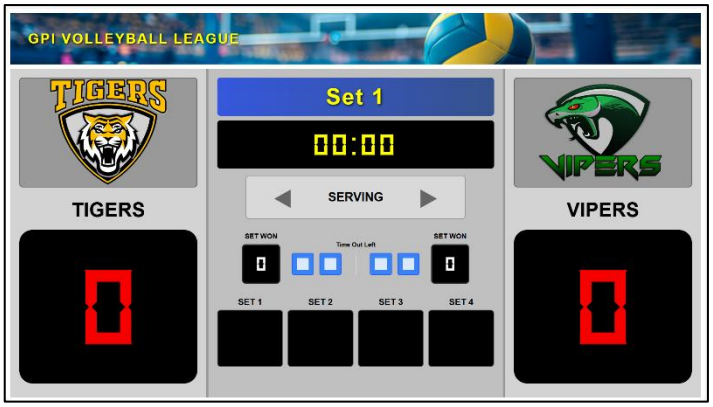
One of the key features of the system is the ability to upload or insert team pictures or logos. The left side of the controller page is designated for Team A details, while the right side is for Team B details. Each team section includes an Insert Picture button that allows the operator to upload the respective team's picture or logo. Once a picture is selected, it is automatically displayed above the button and simultaneously reflected on the Board Page. This ensures that team visuals are shown clearly and consistently on the display monitor during the volleyball match.



- **Insert Team Name**

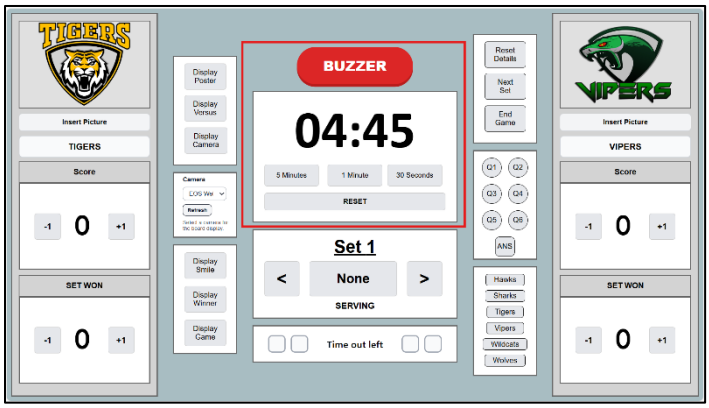
Another feature of the system is the ability to insert team names. Both the left and right sides of the controller page are provided with text boxes for Team A and Team B, respectively. The operator can enter each team's name into the assigned text box. Once the team's name is entered, it is automatically displayed on the Board Page of the system, ensuring that the correct team names are shown clearly on the display monitor during the match.

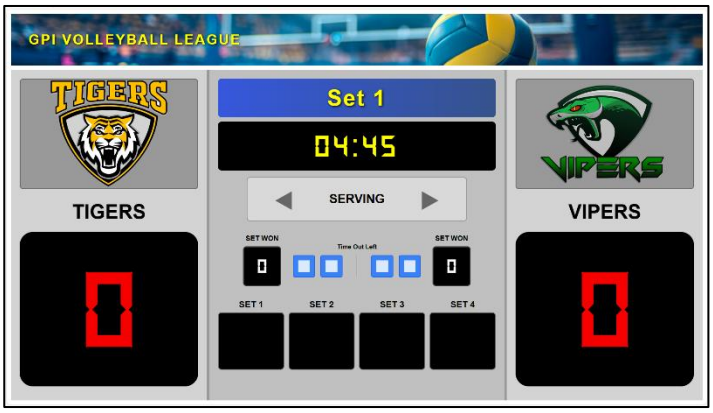




- **Buzzer and Timer Buttons**

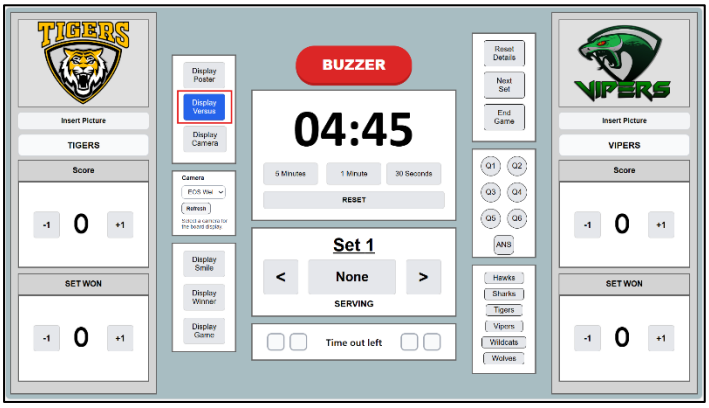
The system includes buzzer and timer controls to support proper game management. By clicking the Buzzer button, the system immediately plays a buzzer sound. The controller page also provides three timer buttons: a 5-minute timer for team warm-up, a 1-minute timer for technical timeouts, and a 30-second timer for each team timeout. When a timer button is clicked, a digital countdown timer is displayed and begins counting down to zero. The countdown is shown in real time on both the controller page and the Board Page. Once the timer reaches zero, the buzzer sound automatically plays. A Reset button is also available to reset the timer display back to 00:00.





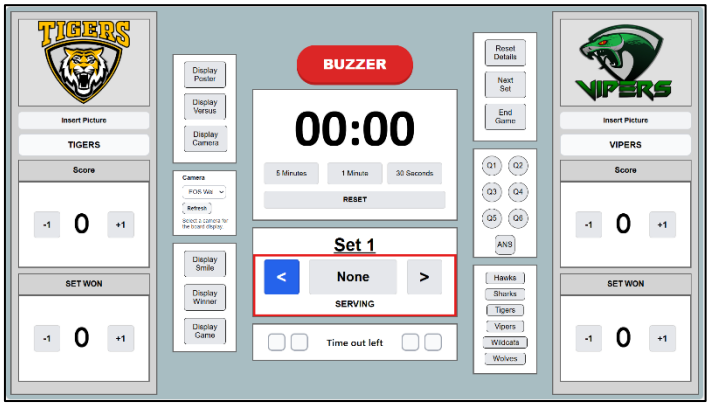
- **Display Versus**

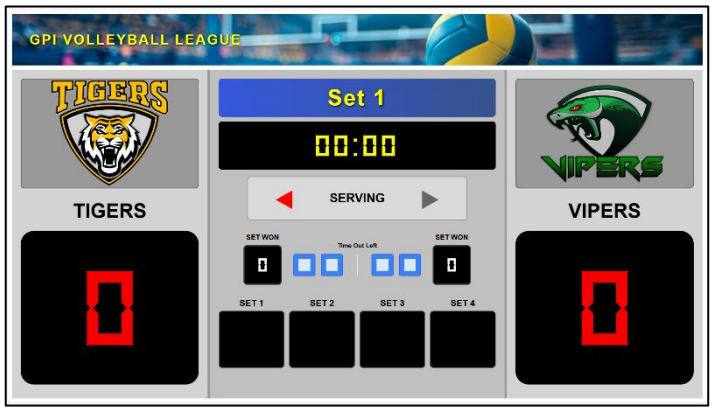
The Display Versus button is used to change the Board Page into a versus display mode. When this button is clicked, the Board Page automatically shows both teams' logos and names in a versus layout. This display also includes a digital timer that counts down in real time. The versus display is mainly used while waiting for the game to start or during team warm-up periods, allowing players, officials, and spectators to clearly see the teams and remaining preparation time. This feature helps improve game readiness and provides a clear visual presentation before the match begins.



- **Serving Team**

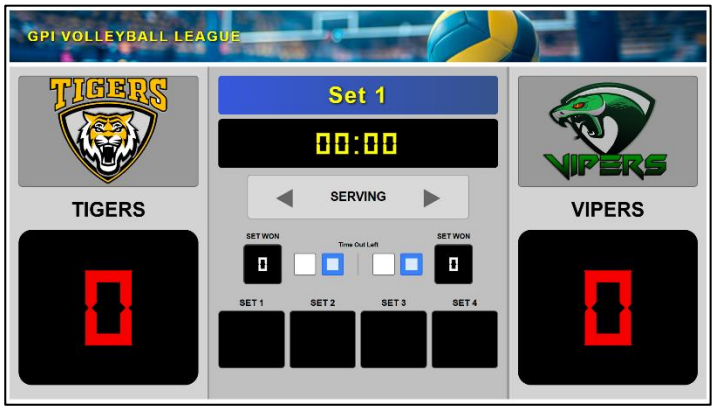
The system includes serving control buttons to indicate which team is currently serving. The left and right serving buttons allow the operator to select the corresponding team as the active server. Once selected, a serving indicator is displayed on the Board Page to clearly show the current serving team. A 'None' button is also provided to remove the serving indicator when no team is serving. This feature helps officials, players, and spectators easily identify the serving team during the match.





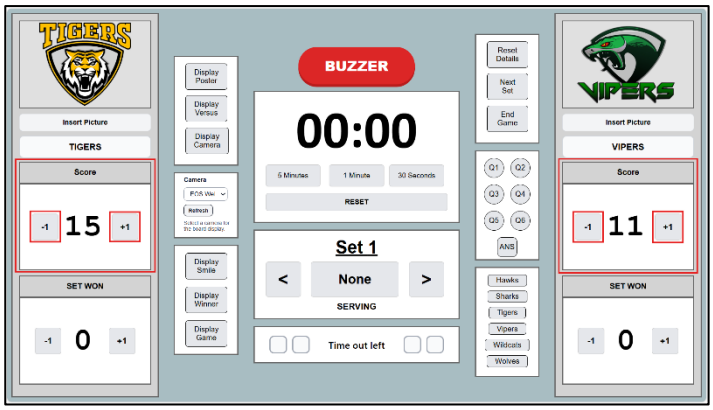
- **Team Timeout**

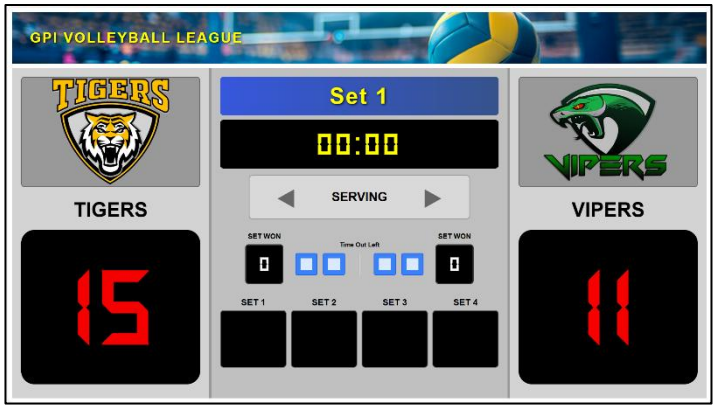
The system also provides timeout indicators for both teams. Each team is assigned a checkbox on the controller page that serves as an indicator of the remaining timeouts available. When a checkbox is selected, the corresponding timeout indicator is automatically displayed on the Board Page. This feature allows officials and spectators to easily see the remaining timeouts for each team, helping ensure proper timeout monitoring throughout the match.



- **Team Score**

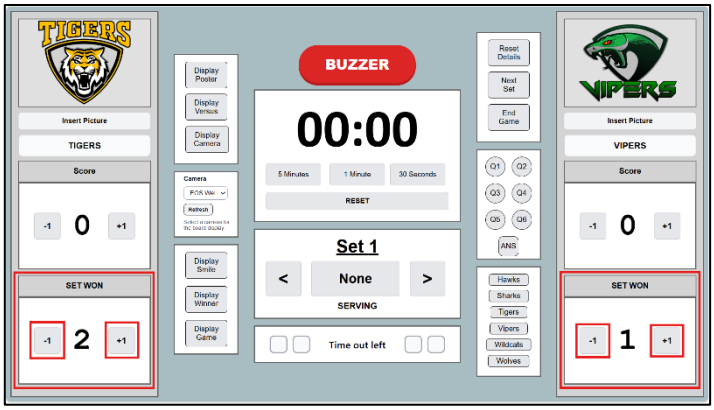
The system also includes a scoring feature for both teams. Each team is provided with controls on the controller page to increment or deduct scores, allowing the operator to update the score accurately during the game. These controls make it easy to adjust the score in real time as gameplay progresses. Once the score is set or modified, it is automatically displayed on the Board Page, ensuring that the current score is visible on the display monitor throughout the match.





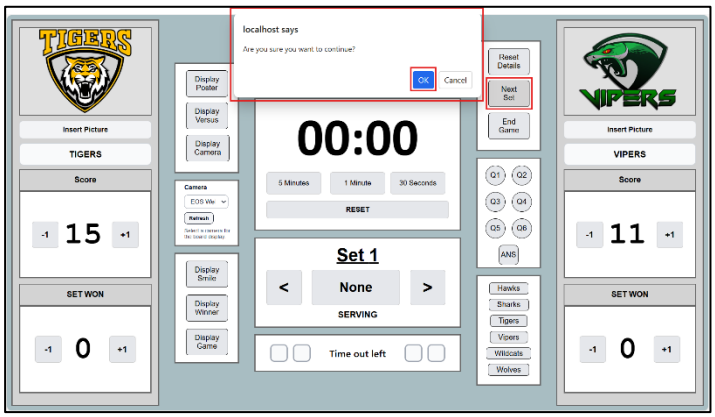
- **Team Set**

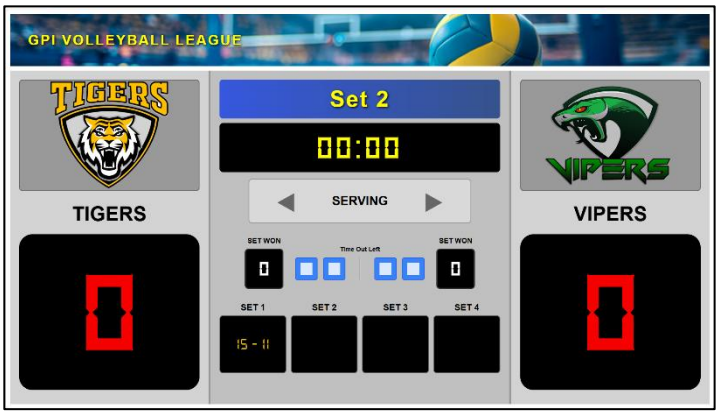
The system also includes a team set feature for managing set points. Similar to the team scoring feature, both teams are provided with increment and deduction buttons on the controller page. These buttons allow the operator to increase or decrease the set count after the completion of each set. Once updated, the current set points for both teams are automatically displayed on the Board Page, ensuring accurate tracking of set results throughout the match.



- **Next Set**

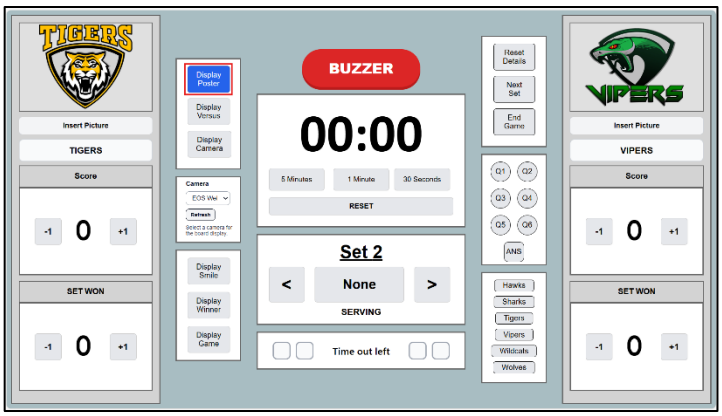
The system includes a Next Set control for transitioning to the following set of the game. By double-clicking the Next Set button, a confirmation modal appears asking the operator to confirm whether to proceed. Once confirmed, the game status is updated to the next set. The current scores are saved and automatically displayed on the Board Page, ensuring accurate recordkeeping and a smooth transition between sets during the match.





- **Display Poster**

The system also includes a Display Poster feature. By clicking this button, the official sportsfest poster is shown on the Board Page. This feature allows the poster to be displayed even when no game is currently in progress. It is useful for presentations, event promotion, or transitional segments between matches, ensuring that the display always remains informative and visually engaging.



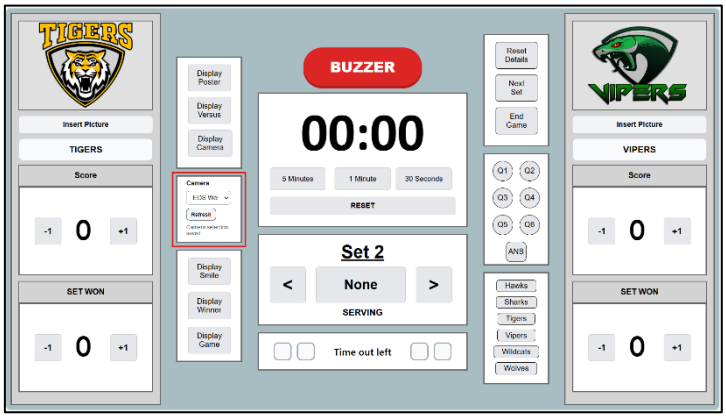
Note: *To change the display poster, upload the image to the scoringboard/display folder and name the file poster.png.*

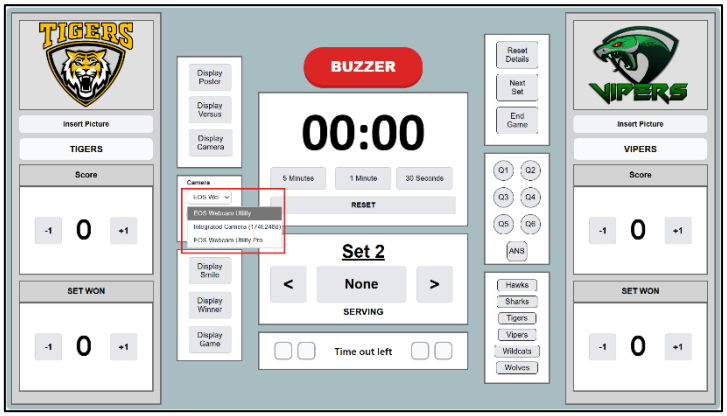
- **Display Camera (Smile Cam)**

The system includes a Next Set control for transitioning to the following set of the game. By double-clicking the Next Set button, a confirmation modal appears asking the operator to confirm whether to proceed. Once confirmed, the game status is updated to the next set. The current scores are saved and automatically displayed on the Board Page, ensuring accurate recordkeeping and a smooth transition between sets during the match.

- **Camera Availability Selection**

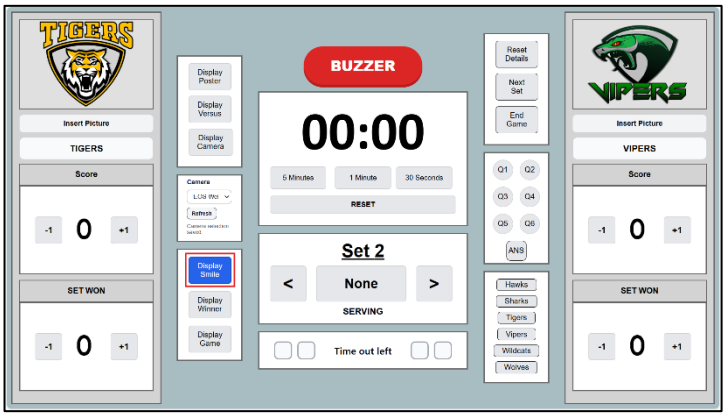
The system also provides a Camera Availability Selection feature that allows the operator to choose which camera will be displayed on the Board Page, such as during the Smile Cam mode and other features. The available camera options are automatically detected based on the camera units connected to the device, including webcams and DSLR cameras. Once selected, the chosen camera feed is displayed in real time on the board display, ensuring flexibility and proper camera integration for audience interaction and event presentation.





- **Display Smile Cam Winner**

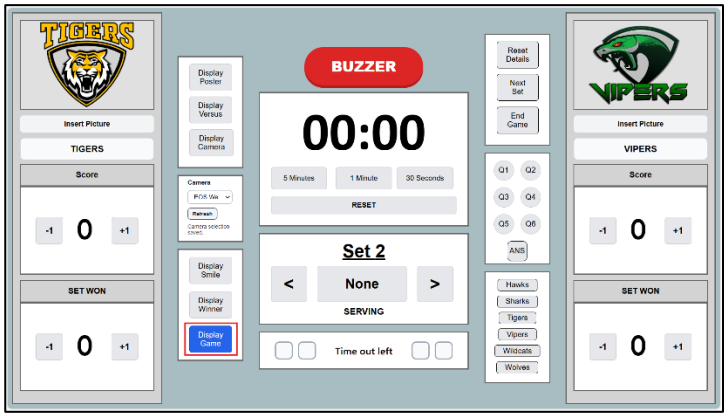
The system also includes a Display Smile Cam Winner feature. When this button is clicked, the Board Page switches to a Smile Cam–style display. However, instead of showing a live camera feed, the system displays only the selected winning image. This feature is used to highlight the Smile Cam winner by presenting the chosen photo clearly on the board display, allowing the audience to recognize and celebrate the winner during the event.

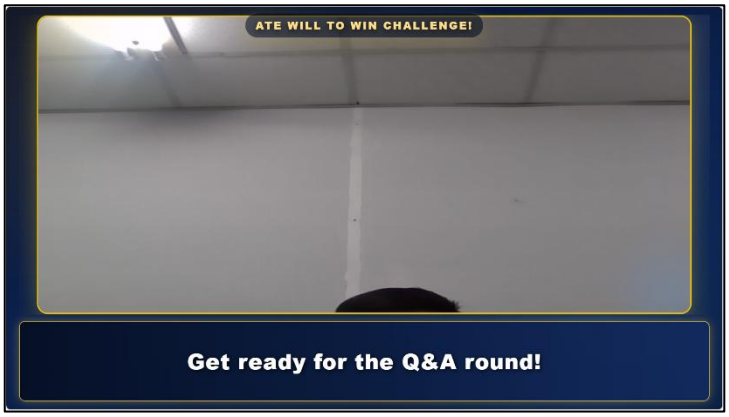


Note: *To change the display smile winner, upload the image to the scoringboard/picture folder and name the file smile.png.*

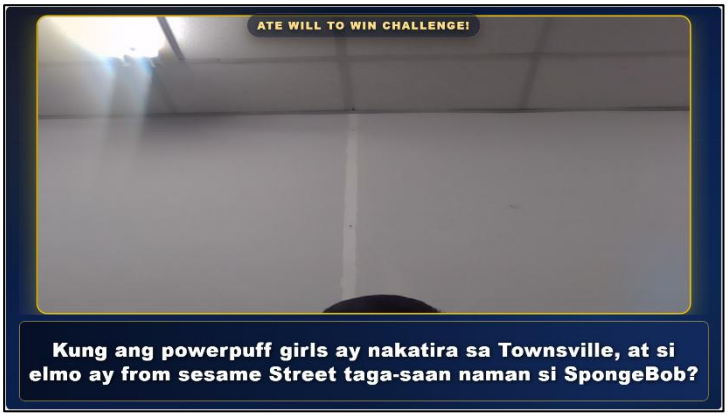
- **Display Game**

The system also includes a Display Game feature. When this feature is activated, the Board Page displays a template frame with a live camera feed for special game segments such as 'Ate Will to Win'. This display allows the audience to interact and participate in the activity while waiting for the next game to begin. The feature helps keep the event engaging during breaks by providing entertaining content and maintaining audience involvement even when no official match is in progress.

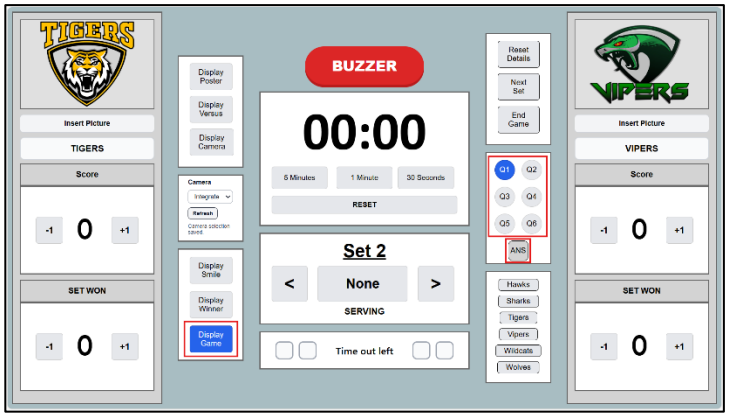


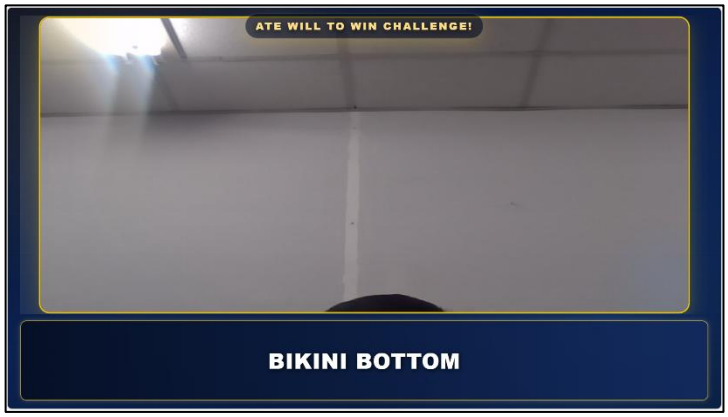


In connection with the Display Game feature, the system provides buttons that control the game questions. By clicking these buttons, different questions are automatically shown on the Board Page. These questions are designed to engage the audience and encourage participation during the game segment.



Aside from the question buttons, the system also includes an ‘Answer’ button for the Display Game feature. When this button is clicked, the answer to the currently displayed question automatically appears on the Board Page. This allows the audience to immediately see the correct answer after participating in the activity. The feature helps complete the interaction by providing clear feedback and maintaining engagement during game segments while waiting for the next match to begin.

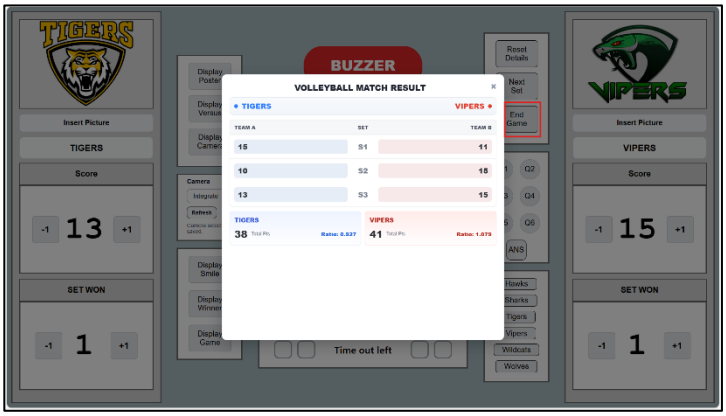




Note: *To modify the questions and answers, access the scoringboard database via phpMyAdmin and update the questions table.*

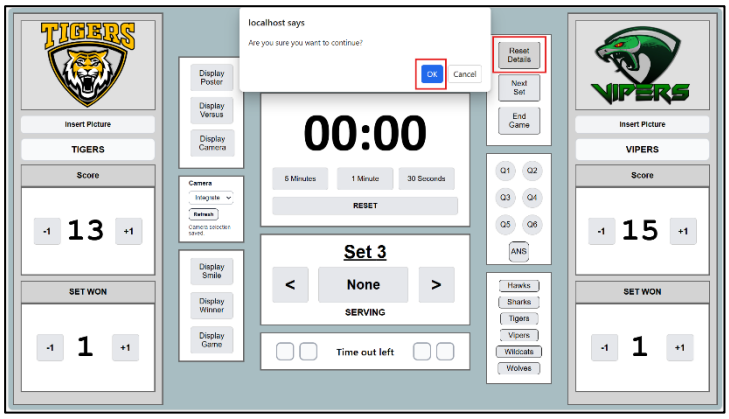
- **End Game**

The system includes an End Game feature to officially conclude the match. By double-clicking the End Game button, a confirmation modal appears to ensure the operator intends to end the game. Once confirmed, the system finalizes and saves the game records. The final game results are then automatically displayed on the Board Page, allowing players, officials, and spectators to clearly view the outcome of the match.



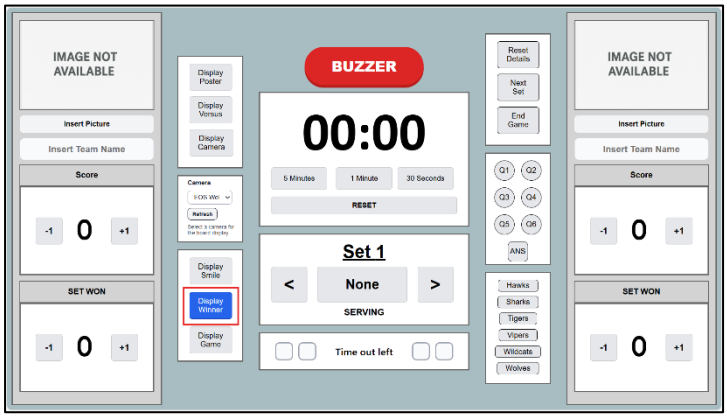
- **Reset Details**

The system also includes a Reset Details feature for match preparation. By double-clicking this button, a confirmation modal is displayed to verify the action. Once confirmed, all match details including scores, team information, timers, and game status, are reset to their default values. This feature is typically used to prepare the system for the next match, ensuring a clean and accurate setup before a new game begins.



- **Display Winner**

The system includes a Display Winner feature that shows the results of the sportsfest. By clicking this button, the Board Page automatically displays the winning teams, including the champion and other placement rankings. This feature allows the audience to easily recognize the winners. It is typically used after the conclusion of the game or event to officially announce and highlight the results of the tournament.



- **Display Winner**

The system also includes team growl sound buttons to enhance excitement during the game. Each button is assigned to a specific team's growl or signature sound. When clicked, the selected growl sound is played to energize the audience and motivate the team. This feature helps create a lively game atmosphere by boosting crowd engagement and adding intensity to key moments of the match.

This page serves as the display page for detailed team records. It presents comprehensive information about each team's game performance, including game number, set scores, total points, sets won, points awarded, point ratio, and match status. This page allows organizers and officials to easily review and monitor team records throughout the tournament. By providing an organized and detailed overview of game results, the system ensures accurate tracking and transparency of team performance during the sportsfest.
